## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1 - 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over the combined teachings of Dodd et al (US5833614) in view of Haider (US6135963)

Dodd teaches in cols. 5 – 6 that pulse width modulation can be practiced within for example the Gaussian envelope of the transmission burst in order to minimize harmonic transmission in the modulation, and wherein the so-modulated waveform can be amplitude modified per channel in order to apodize the transmission, see col. 4 bottom – col. 6. However it would have been obvious in view of Haider to use pulse width modulation with less energy in a uniform progression to the array edge per Fig.3

in order to reduce harmonic content in the transmission, since this was known to

diminish the harmonic energy expressed in the sidelobes, see col. 5 discussion therein.

Ma et al (US6599245) is cited as of interest for its Figs. 4A – 4B. [Note that with respect

to the latter the examiner is presuming that the effective date of this claimed material is

later than the Ma et al filing date.]

Burke et al (US4803994) and Erikson et al (US5301674) are cited as of interest in that

they control burst cycle length to adjust transmission bandwidth and the amount of

energy delivered to a focal depth respectively.
